-----

By 2030, total EVs could reach between 147,000 to 279,000 (low to high scenario). The majority of this is driven by swap electric two-wheelers which account for 79% and 76% of total EV sales in the low ...

And the uncomfortable truth is this: Africa will not lead the global battery race simply because it owns the minerals. Africa will lead only if it builds the factories, talent, logistics and ...

With the world rapidly shifting toward electrification and renewable energy storage, African nations hold strategic leverage through their abundant deposits of cobalt, lithium, graphite, ...

Almost all of Africa's cobalt, manganese, lithium and graphite are exported, leaving the continent at the bottom of the value chain while other regions capitalise on high-value battery ...

This paper explores DRC and Zambia's plans to build a regional battery industry, leveraging their copper and cobalt resources, while navigating governance, geopolitical challenges, ...

The authors show that battery electric vehicles with solar off-grid systems can cost effectively reduce life-cycle emissions well before 2040.

This report analyzes the African countries that are the new power brokers in the EV battery supply chain, examining their resource dominance, the geopolitical and investment dynamics at play, and the ...

Access to clean, reliable electricity is one of the greatest challenges to sustainable development in Africa. Energy storage, particularly batteries, will be critical in supporting Africa's ...
