These pilots are focused on the development of new furnace technologies that replace natural gas with clean hydrogen fuel, allowing zero-carbon glass production.

Based on the furnace with production of 600 t/d, two methods of increasing fuel supply and introducing electric boosting are investigated to increase glass production.

It provides three possible scenarios: Two extreme scenarios that either favor electrification or hydrogen and a third hybrid scenario where they selected what they expected to be ...

Glass Futures is currently working with partners in Nigeria to explore how sustainable biofuel supply chains might be established in these regions, using fuels produced from waste agri ...

This systematic review poses five questions to examine these issues and themes: What alternatives exist to abate the climate effects of glass and thus make the full life cycle of glass more ...

The transition to solar, wind, and hydropower offers glass manufacturers a practical pathway to reducing carbon emissions, complying with environmental regulations, and achieving ...

Solar energy technologies require materials, such as metals and glass, that are energy intensive to make. The environmental issues related to producing these materials could be associated with solar ...

In order for the vision of solar glass without emissions to become reality, Gridparity AG is working with glass technologists and investors to develop a concept for the construction of the ...
