To evaluate the expression given by $400g^2 - 0.9g$; g when $g = 0.6$, we will substitute g with 0.6 in the expression and calculate step by step: Substituting the Value of g :

To evaluate $3f(2)$, we assume the function $f(x) = x^2$. Calculating $f(2)$, we find it equals 4 , then multiplying by 3 gives 12 . Thus, $3f(2) = 12$.

To evaluate the expression $|-31.889|$, we need to understand the concept of absolute value. The absolute value of a number is its distance from zero on the number line, disregarding ...

To evaluate $\log_4 64$, you want to find the power to which the base 4 must be raised to get 64 . In other words, find the exponent x in the equation: $4^x = 64$ Let's solve this step by step: Express ...

Evaluate the expression shown below and write your answer as a fraction or mixed number in simplest form.
 $1511 - 0.571$

Evaluate the function for the given values to determine if the value is a root. $p(-2) = p(2) =$ The value is a root of $p(x)$.

To evaluate $\log_{125} 5$, we can use the change of base formula, which is given by: $\log_b a = \frac{\log_c a}{\log_c b}$ This allows us to rewrite the logarithm in terms of more familiar bases, such as 10 or e ...

To evaluate (0.01024) raised to the power $-2/5$, use the rule that states any number raised to the power $-a$ is equal to 1 divided by that number raised to the power a .
