You'll want to inspect your saddle closely and at all angles for significant differences in symmetry and balance, and also for defects like twisted trees and asymmetrically installed flaps and ...

Is your saddle truly safe? Learn the crucial weekly and monthly checks for your saddle's tree, panels, and billets to prevent failures and protect your horse.

he joists, you'll need to drill a pilot hole. To do this, start by drilling a small hole in the ceiling at one end of the joist. This will help to prevent the drill bit from slipping your door fits perfectly into its frame.

Saddle panels are one part of the saddle that can have multiple options. Being the weight bearing surface of the saddle, it is very important to get the correctly shaped panel that provides the ...

Yesterday when I dismounted, I saw that I have worn a hole (think more of a 5" long vertical laceration though) in the panel of my saddle where the top of my left calf goes.

EDIT - The panel connectors are not long enough to allow enough thread for the nut to hold them secure. I will have to thin out the wall thickness of the Pelican case to make this work OR you can ...

Toyota doesn't want anybody drilling holes in their structures. Truth be told, they would probably rather have your vehicle rust out - in a reasonable amount of time - so you'll buy another one.

Drilling holes can weaken the structural integrity of the panel, potentially compromising its ability to absorb and distribute forces, thus jeopardizing the safety of the vehicle's occupants.
