Is solar power the future of electricity generation?

Solar continues to dominate new electricity generation capacity added to the grid in the United States, according to the Energy Information Administration's (EIA) latest release of its Electric Power Monthly report with data through March 2025.

Will solar power grow in 2025?

We expect that solar electricity generation supplied to the grid managed by the Electric Reliability Council of Texas (ERCOT) will grow from 56 BkWh in 2025 to 106 BkWh by 2027. Increasing amounts of battery storage capacity help to support the fluctuations in solar output during the day.

Is solar energy the key to national electricity generation gains in 2025?

So far in January, EIA has issued three brief studies tapping solar energy to be the major player responsible for national electricity generation gains in 2025. (EIA is the statistical agency under the U.S. Department of Energy that is tasked with providing independent analysis and metrics about energy consumption and demand.)

Will solar power and wind power grow in 2027?

We expect the combined share of generation from solar power and wind power to rise from about 18% in 2025 to about 21% in 2027. In our STEO forecast, utility-scale solar is the fastest-growing source of electricity generation in the United States, increasing from 290 BkWh in 2025 to 424 BkWh by 2027.

Solar will lead power generation growth in the US through 2026, the EIA says. As renewable generation rises, natural gas generation will decline 3% this year. Solar power capacity ...

In 2024, net solar power generation in the United States reached its highest point yet at 218.5 terawatt hours of solar thermal and photovoltaic (PV) power.

We expect the combined share of generation from solar power and wind power to rise from about 18% in 2025 to about 21% in 2027. In our STEO forecast, utility-scale solar is the fastest ...

The US is experiencing its most transformative year for electricity generation in over 20 years, driven by a surge in solar energy and backed by large-scale battery storage.

In September, 98% of new electric generating capacity in the United States came from solar, marking 25 consecutive months where solar led other energy sources.

This dataset contains yearly electricity generation, capacity, emissions, imports and demand data for European countries. You can find more about Ember's methodology in this document.

The U.S. Energy Information Administration predicts solar energy will be the leading force behind this year's growth in the electric power industry.

While our commercial and community solar outlooks have risen slightly due to enhanced project pipeline visibility, we've downgraded our residential outlook as tight module availability is ...
