Renewable generation increases 84% in the five years to 2030, and doubles again by 2050. Solar, wind and other renewable sources serve 67% of the world's demand for electric power ...

Almost 70 gigawatts (GW) of new solar generating capacity projects are scheduled to come online in 2026 and 2027, which represents a 49% increase in U.S. solar operating capacity ...

According to the latest Short-Term Energy Outlook from the U.S. Energy Information Administration (EIA), solar power generation in the U.S. is projected to skyrocket by 75% from 163 ...

If the solar market trajectory continues as projected, total global solar installations are set to triple over the next five years, surpassing 6 TW by 2029 in the Medium Scenario.

Over the past five years, this sustained growth has shifted solar from a supplemental resource to a dominant source of new power generation, driven by falling technology costs, rising ...

The increase in solar PV capacity is set to more than double over the next five years, dominating the global growth of renewables. Low costs, faster permitting and broad social acceptance continue to ...

Wood Mackenzie projects that annual community solar installations will contract beginning in 2025, with a little over 1 GW installed each year for the next 5 years.

Growth in utility-scale and distributed solar PV more than doubles, representing nearly 80% of worldwide renewable electricity capacity expansion. Low module costs, relatively efficient permitting processes ...
