What is the Dongao Island megaWatt-level independent smart microgrid project?

Banner image: The Dongao Island megawatt-level independent smart microgrid project was China's first megawatt-level microgrid system with complementary wind, solar, diesel, and energy storage, and was also China's first commercial-run island smart microgrid system. The power supply is flexible and especially suitable for island and remote areas.

What is a microgrid system?

The term "microgrid" refers to a small power generation and distribution system composed of distributed generators, energy storage devices, energy conversion devices, related loads, monitoring devices and protective devices. It is an autonomous system that can realize self-control, protection and management.

What are the basic features of a microgrid?

Microgrids generally have four basic features: (1) "Micro", microgrid voltage levels are generally below 10 kV (kilovolts), the system scale is generally MW (megawatt) level or smaller, the grid is connected with end users, and the electric energy provided in the microgrid is typically used locally.

What is the research on DC microgrids in China?

From 2009 to 2016, research on DC microgrids in China has gradually involved many different aspects, such as the study of DC microgrid power electronic converters, DC circuit breakers, and other key equipment, as well as operation control technology, protection, and energy management. 1.2 China's Current and Planned Policies Regarding MG
